

Afinion Project-Viewer for Mac, Sun, Linux, Unix

Basic requirements: Java runtime 1.4 or higher must be installed.

You can run APV by double-clicking the file „ProjectViewer.jar“ using the file manager or any similar product.

If your configuration doesn't allow that form of activation, you can always start APV the following way:

1. The environment variable JAVA_HOME must point to your Java-installation.
2. Then you can start the Project-Viewer with the following command: `java -jar ProjectViewer.jar`.
